

The NOvA Experiment

P5 Meeting

SLAC

21 February 2008

Gary Feldman

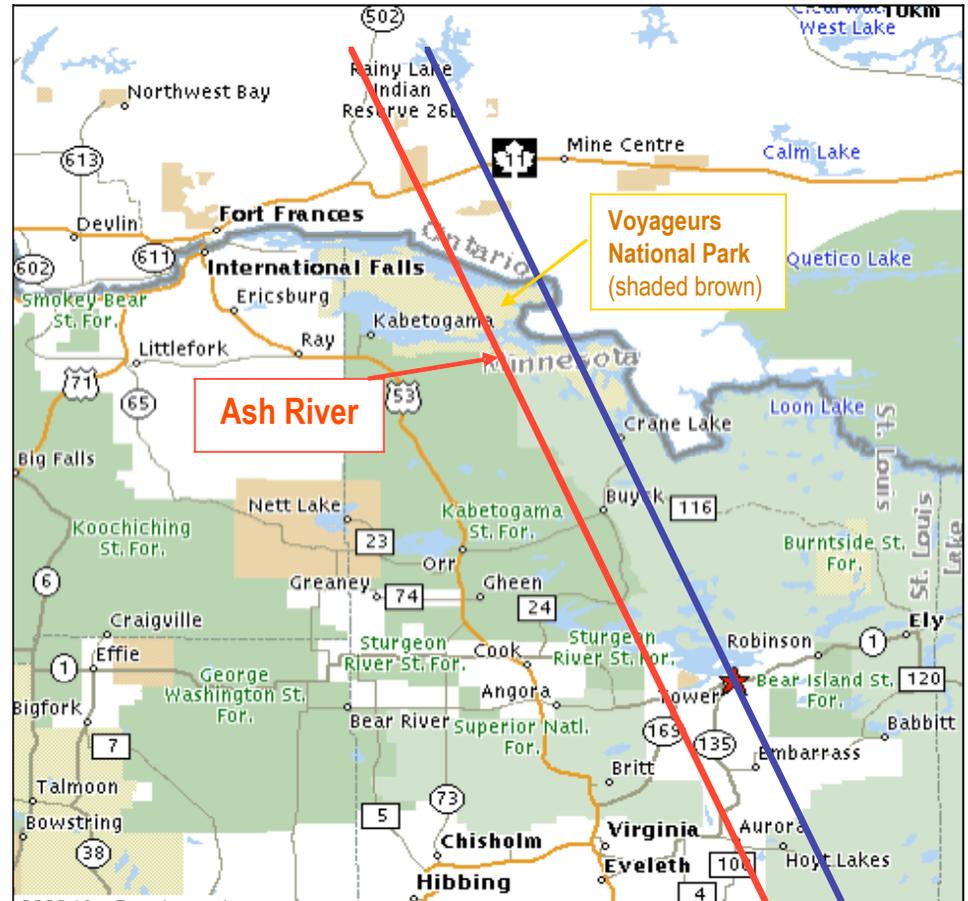

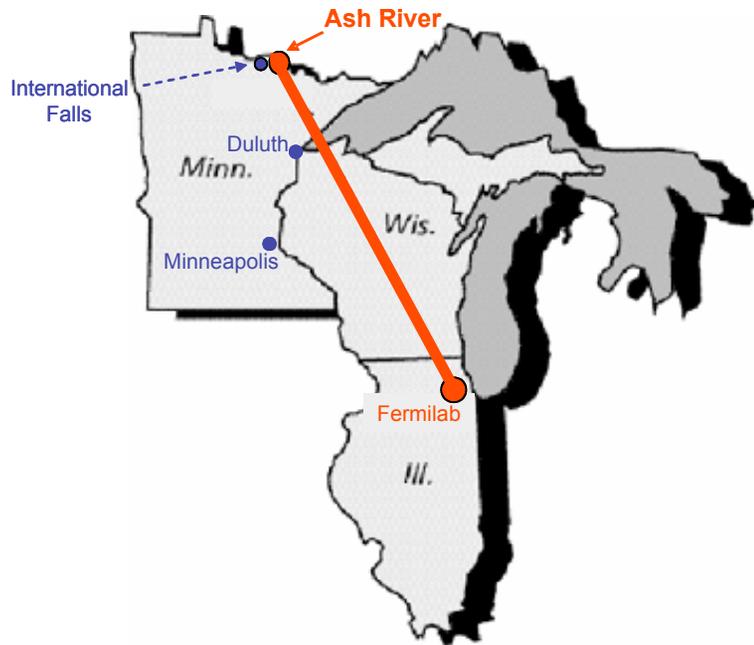

What is NOvA?

- NOvA is a second-generation experiment on the NuMI beamline, which is optimized for the detection of $\nu_{\mu} \rightarrow \nu_e$ oscillations.
 - It will give an order of magnitude improvement over MINOS in measurements of ν_e appearance and ν_{μ} disappearance.
- NOvA is a “totally active” tracking liquid scintillator calorimeter, sited off-axis to take advantage of a narrow-band beam.
- The NOvA project also includes accelerator upgrades to bring the beam power from 400 kW to 700 kW.
- NOvA’s unique feature is its long baseline, which gives it sensitivity to the neutrino mass ordering.
- NOvA is complementary to both T2K and Daya Bay.

NOvA Site

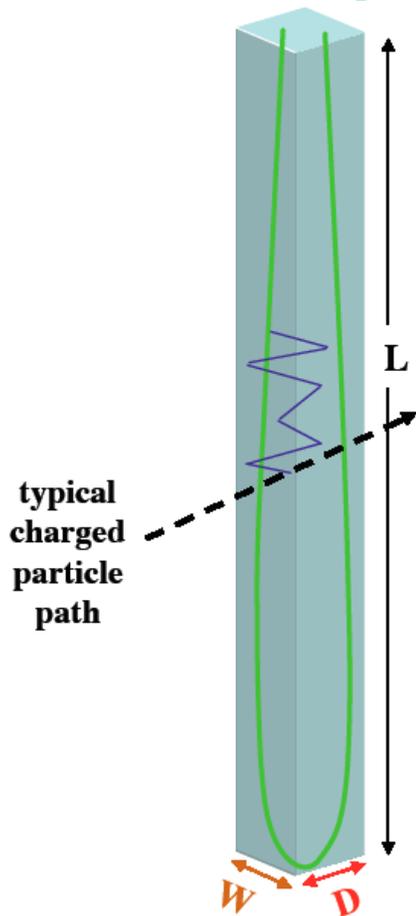

The Ash River site is the furthest available site from Fermilab along the NuMI beamline. This maximizes NOvA's sensitivity to the mass ordering.

NOvA Basic Detector Element

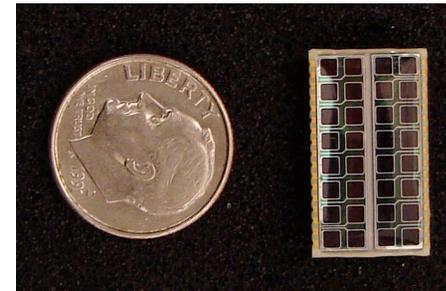

To 1 APD pixel

Liquid scintillator in a 4 cm wide, 6 cm deep, 15.7 m long, highly reflective PVC cell.

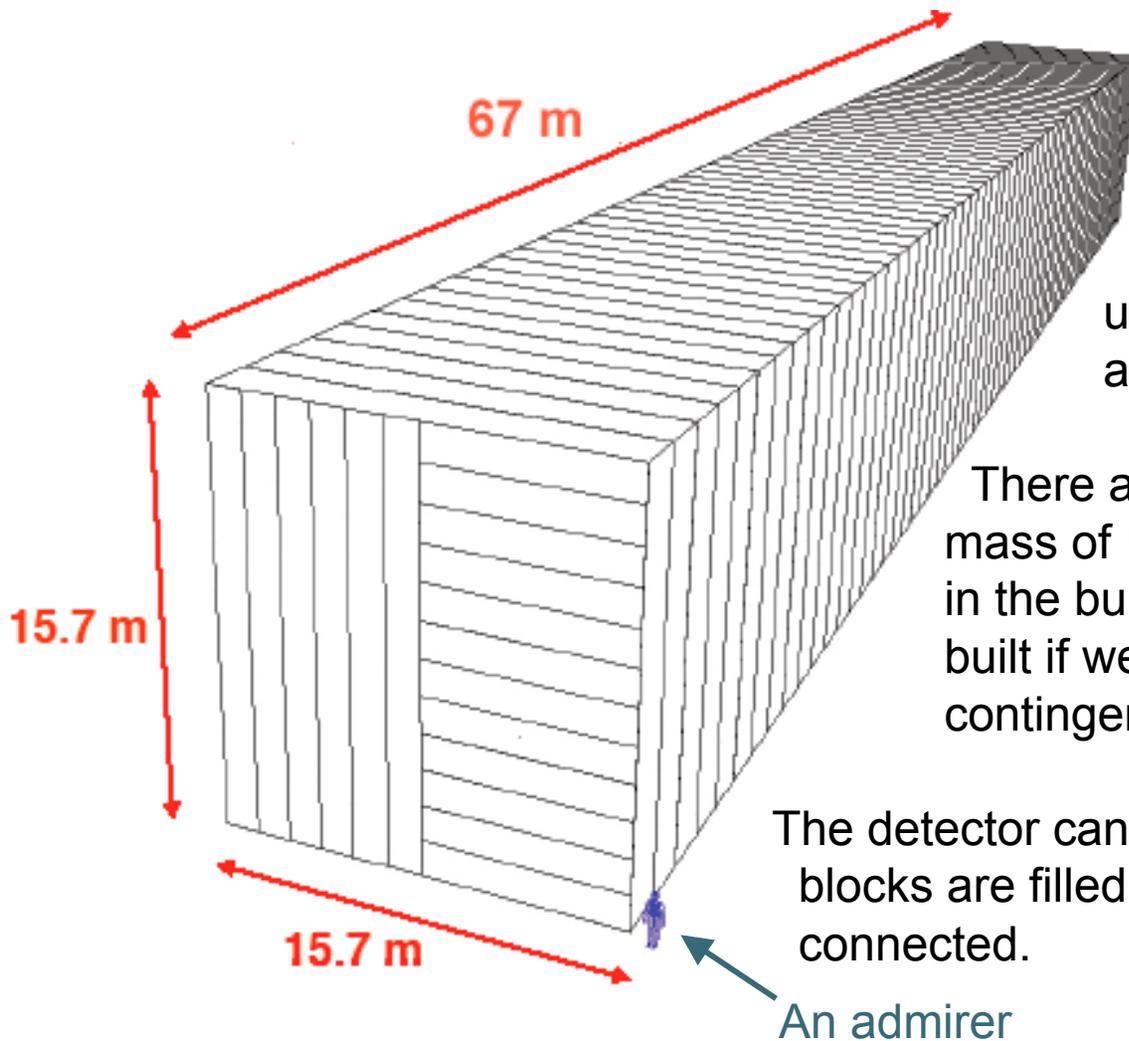

Light is collected in a U-shaped 0.7 mm wavelength-shifting fiber, both ends of which terminate in a pixel of a 32-pixel avalanche photodiode (APD).

The APD has peak quantum efficiency of 85%. It will be run at a gain of 100. It must be cooled to -15°C and requires a very low noise amplifier.

NOvA Far Detector

The cells are made from 32-cell extrusions.

12 extrusion modules make up a plane. The planes alternate horizontal and vertical.

There are 1003 planes, for a total mass of 15 kT. There is enough room in the building for 18 kT, which can be built if we can preserve half of our contingency.

The detector can start taking data as soon as blocks are filled and the electronics connected.

An admirer

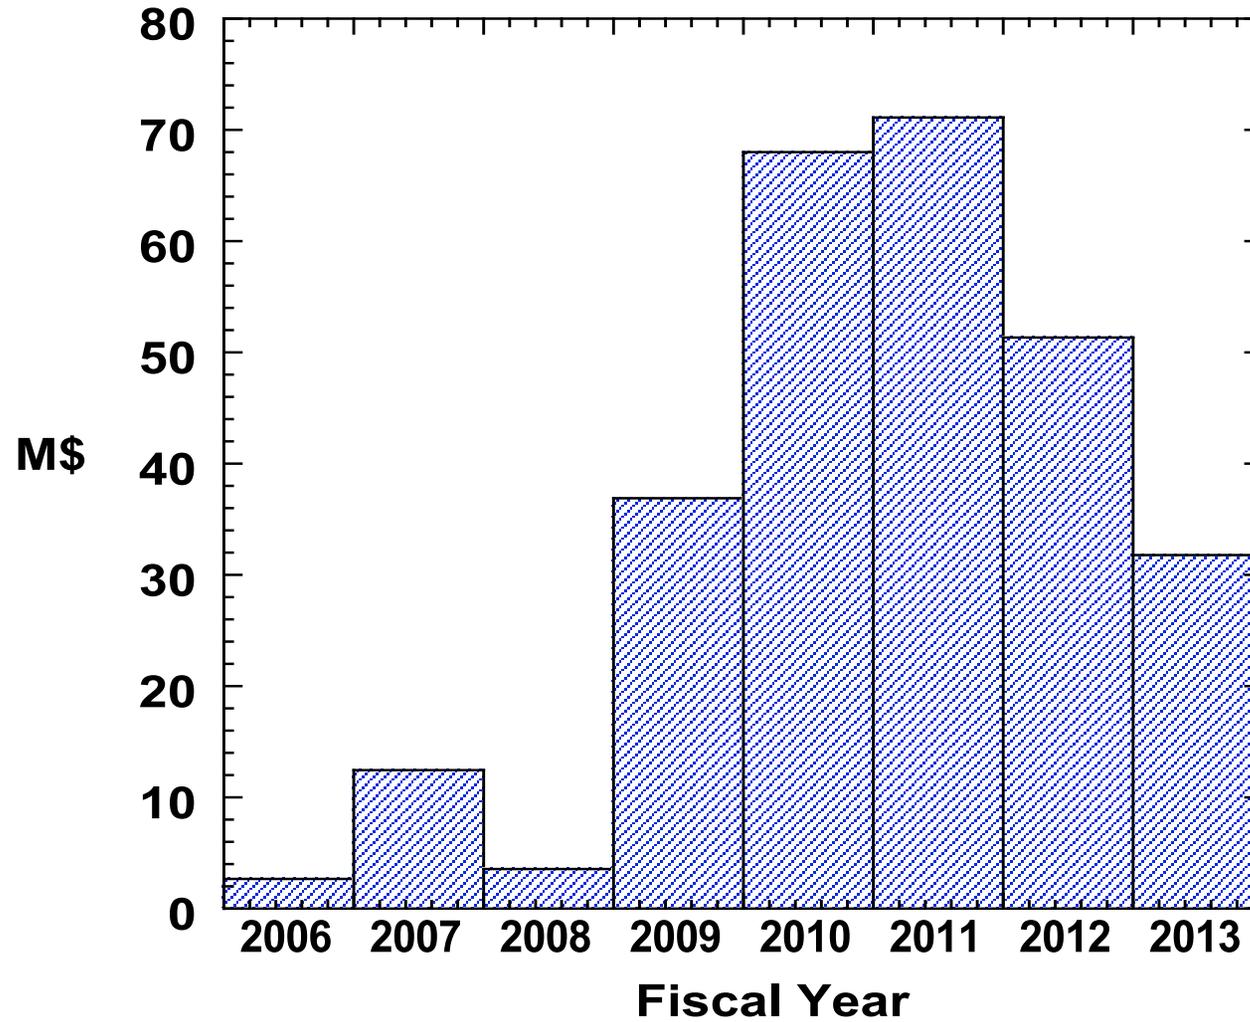

NOvA Timeline

- May 2002 1st Workshop
- Jun 2002 Letter of Intent
- Mar 2004 Proposal to the Fermilab PAC
- Mar 2005 Revised Proposal to the PAC
- Apr 2005 Fermilab Stage 1 Approval
- Nov 2005 CD-0 Granted
- Feb 2006 Recommended by NuSAG
- Oct 2006 Recommended by P5
- May 2007 CD-1 Granted
- Oct 2007 Passed CD-2/3a Review
- May 2008 CD-2/3a Granted
- Nov 2008 CD-3b Granted
- Apr 2009 Start of Construction
- Jun 2011 Far Detector Building Beneficial Occupancy
- Aug 2012 1st 2.5 kT of the Far Detector Online
- Jan 2014 Full Far Detector Online

DOE Funding Profile

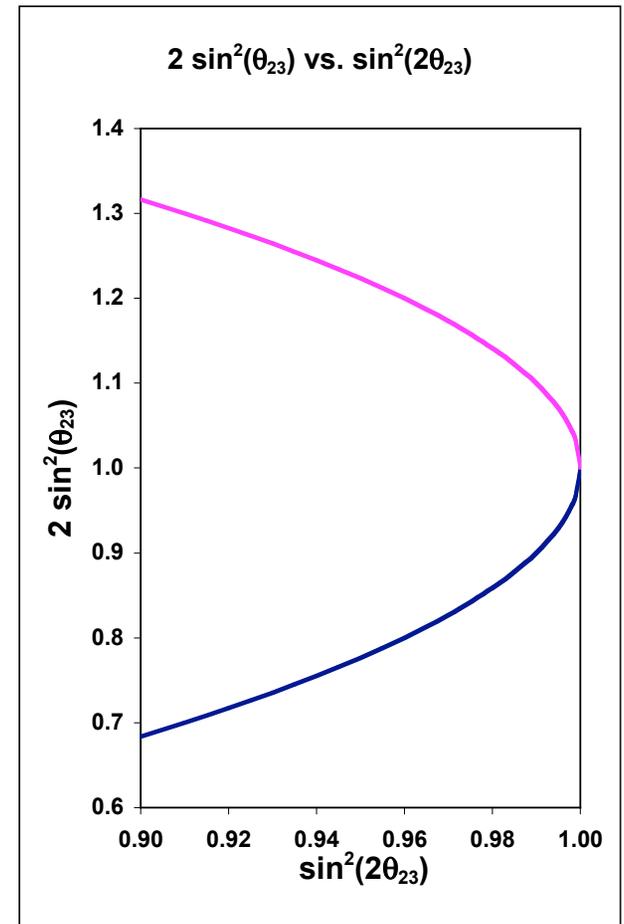

Reactor vs. Accelerator

Peter explained the physics of neutrino oscillations well, so I need not repeat it. However, I would like to expand on a couple of points.

Reactor and accelerator experiments do not measure the same thing. Reactors are sensitive to $\sin^2(2\theta_{13})$, while accelerators are sensitive to $\sin^2(\theta_{23}) \sin^2(2\theta_{13})$. If $\theta_{23} \neq \pi/4$, these quantities can be quite different.

The good news is that a comparison of NOvA and Daya Bay can break this ambiguity and determine whether ν_3 couples more to ν_μ or ν_τ .

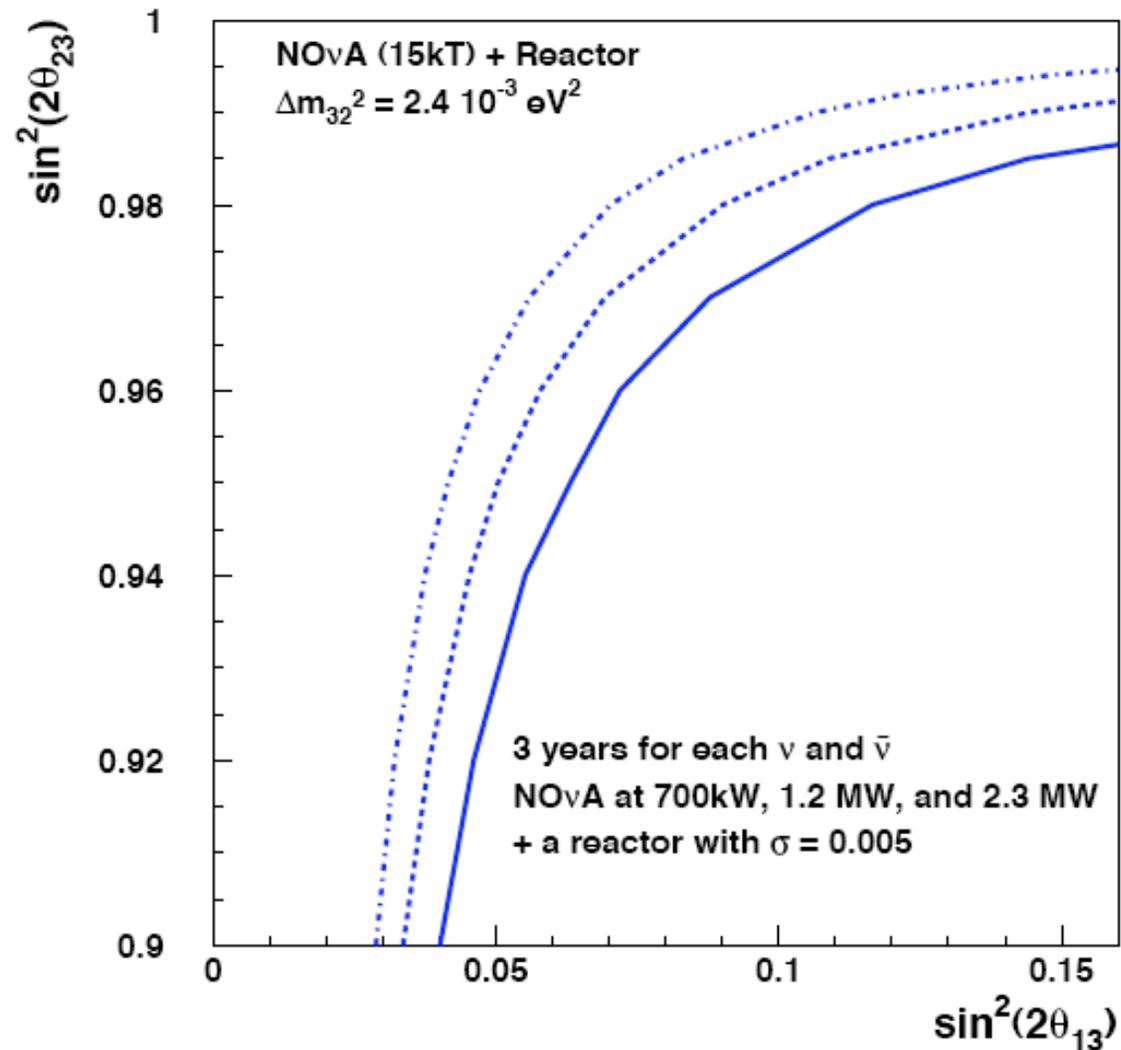

95% CL Resolution of the θ_{23} Ambiguity

The ambiguity can be resolved in the region below and to the right of the curves.

The sensitivity depends on the mass ordering, δ , and the sign of the ambiguity itself. The curves represent an average over these parameters.

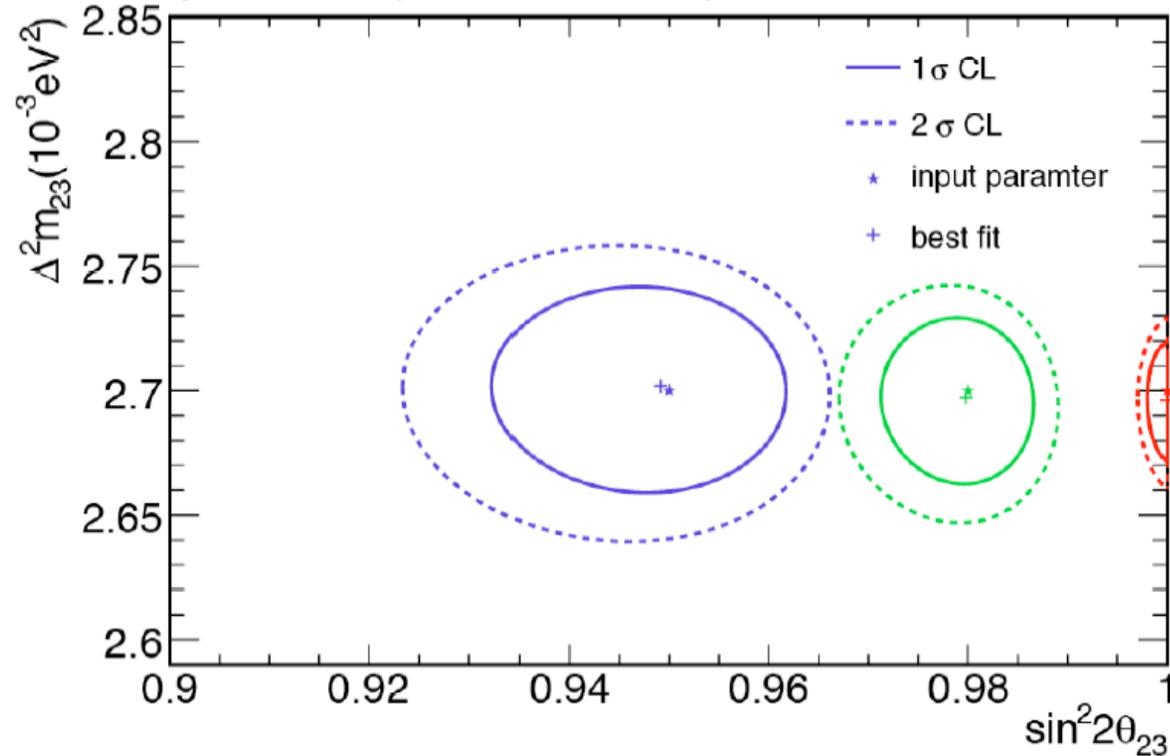

Measurement of $\sin^2(2\theta_{23})$

This calculation uses NOvA's excellent energy resolution on ν_μ CC events.

Sensitivity Contours (18 kt*36E20 POT)

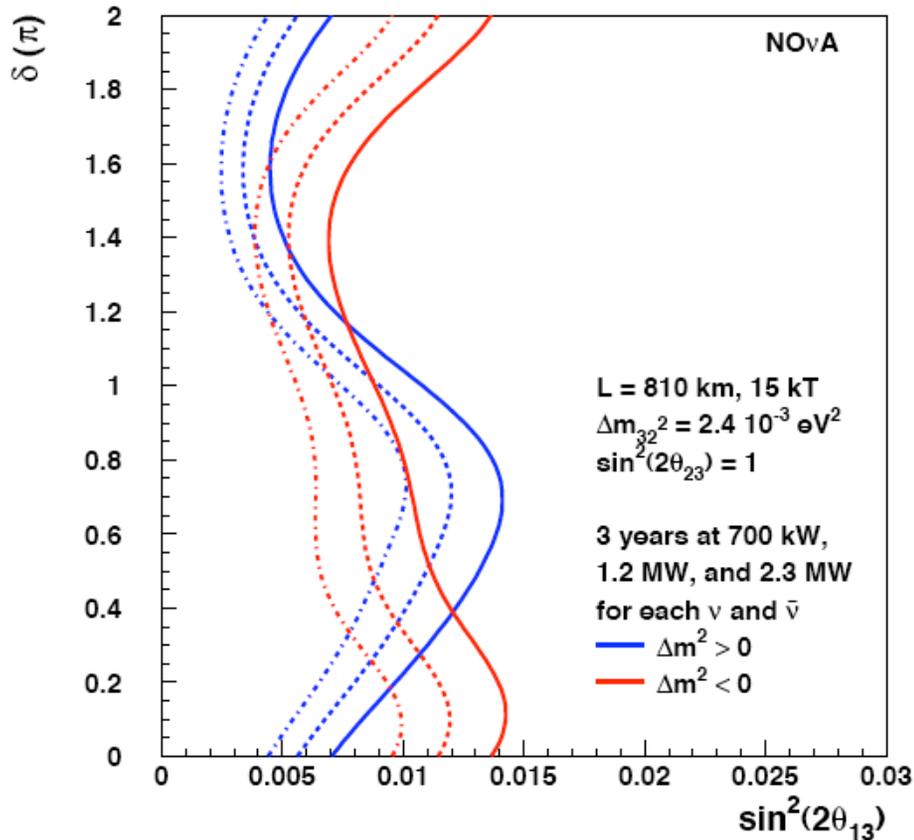

It is a parameterized calculation, which needs to be redone with a full reconstruction.

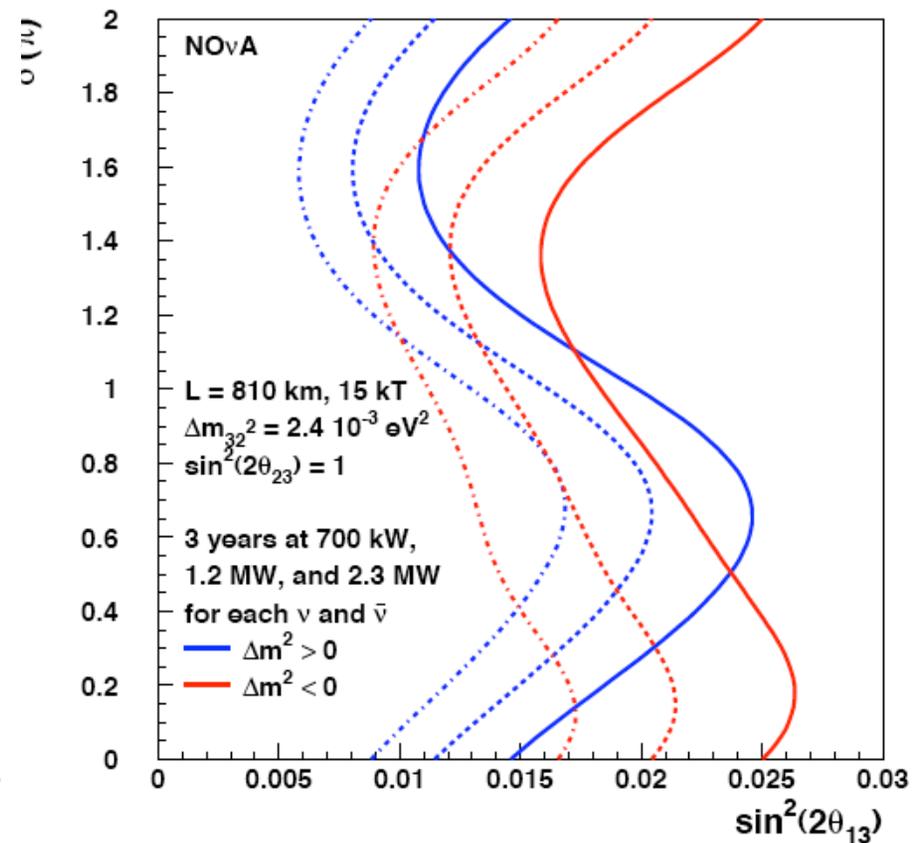

Sensitivity to $\sin^2(2\theta_{13}) \neq 0$

90% CL Sensitivity to $\sin^2(2\theta_{13}) \neq 0$

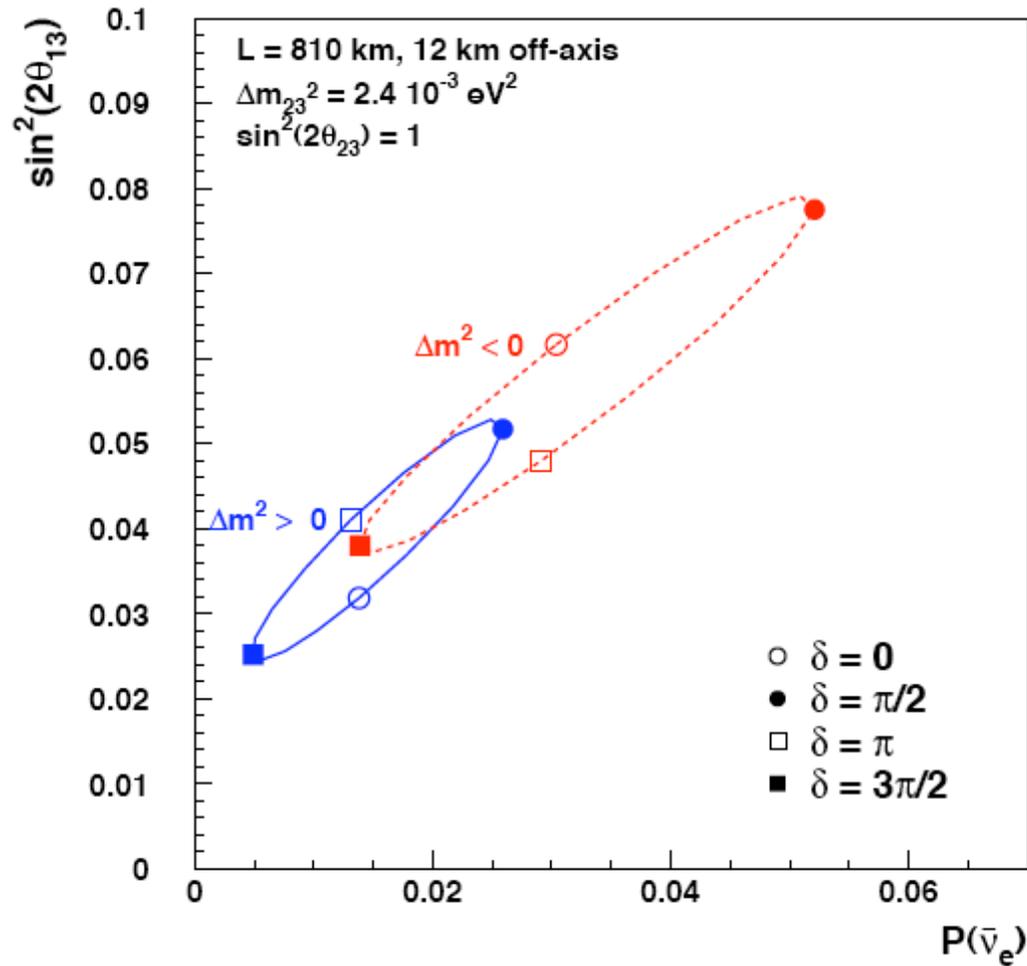

3 σ Sensitivity to $\sin^2(2\theta_{13}) \neq 0$

Parameters Consistent with a 2% $\nu_\mu \rightarrow \nu_e$ Oscillation Probability

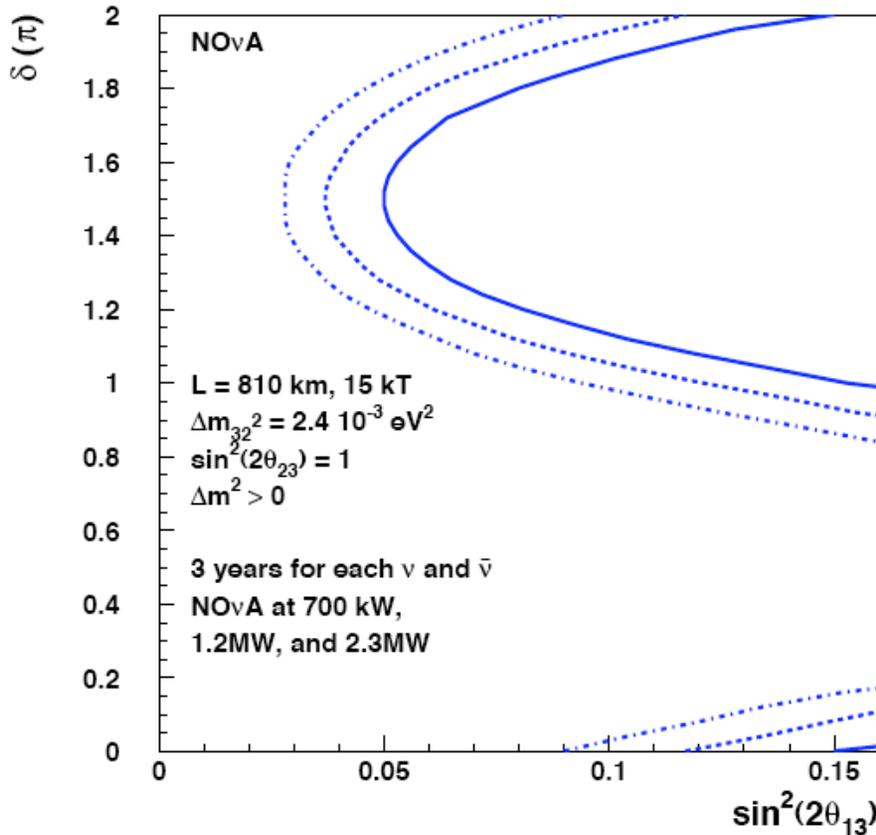

Strategy for Determining the Mass Ordering

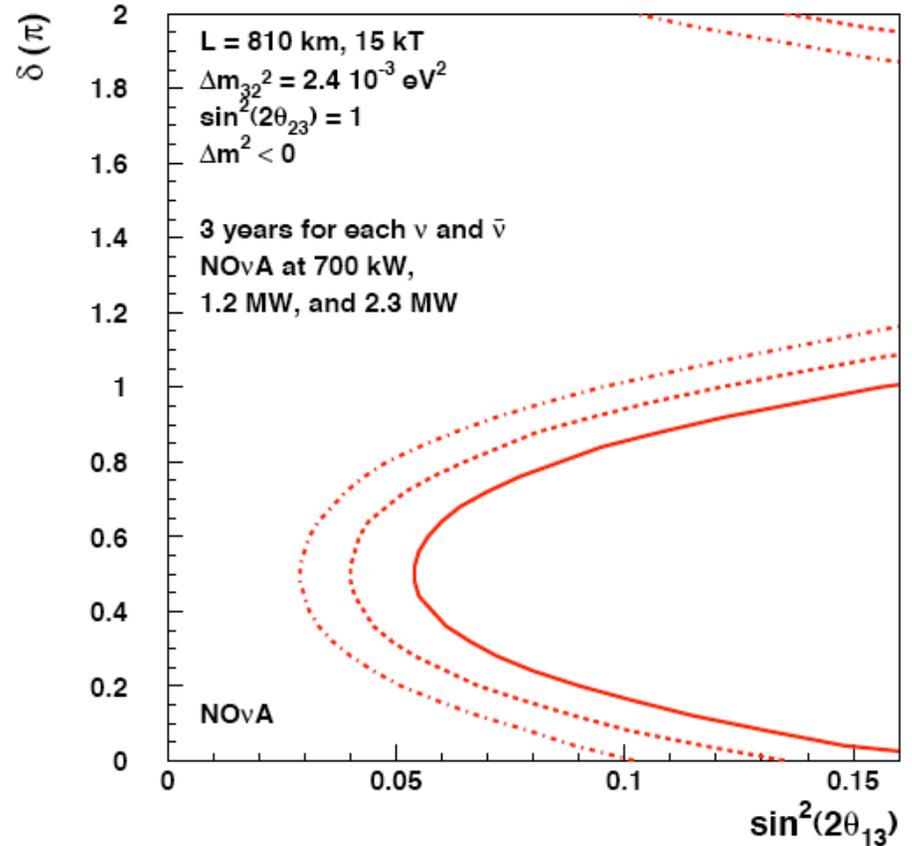

- If the solar-atmospheric interference term goes in the same direction as the matter effect, then there is no ambiguity and NO ν A can determine the mass ordering by itself, given sufficient integrated beam.
- If the solar-atmospheric interference term goes in the opposite direction as the matter effect, then there is an inherent ambiguity and NO ν A cannot determine the mass ordering by itself. But it can be determined, in principle, by comparing NO ν A and T2K.
 - If the neutrino oscillation probability is larger in NO ν A than in T2K, it is the normal mass ordering; if the opposite, it is the inverted mass ordering.

95% CL Resolution of the Mass Ordering NOvA Alone

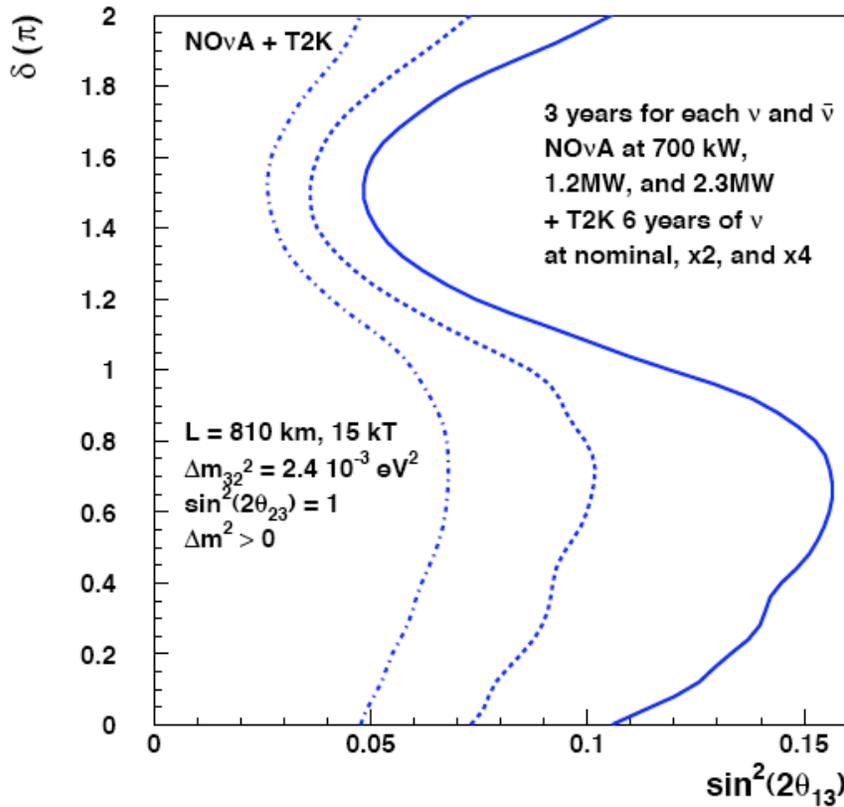

Normal Ordering

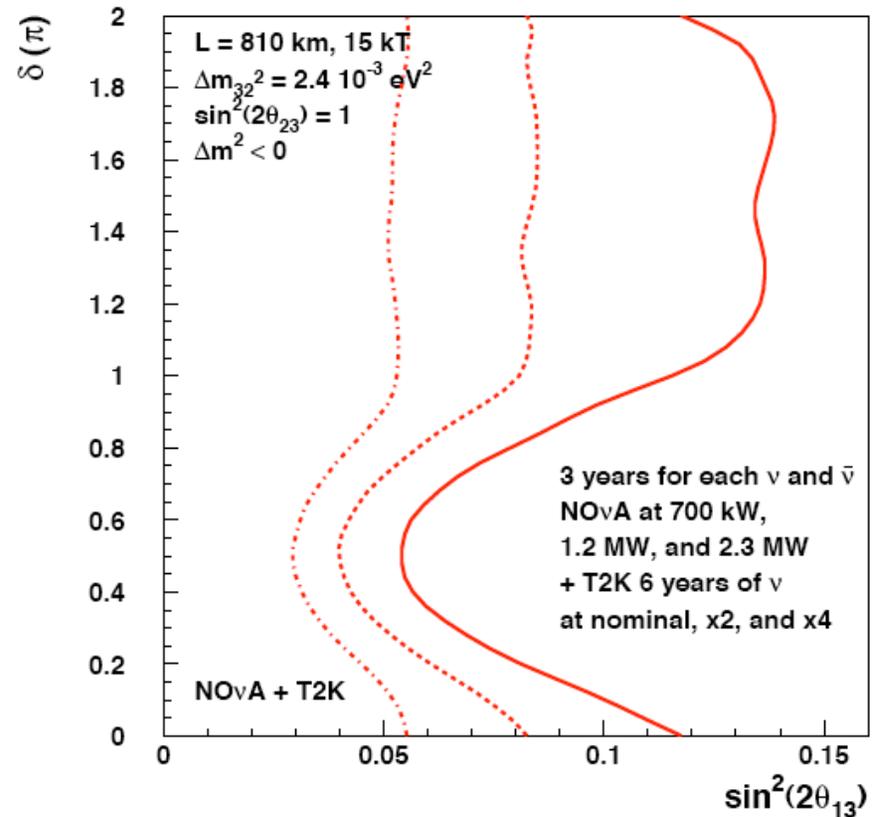

Inverted Ordering

95% CL Resolution of the Mass Ordering NOvA Plus T2K

Normal Ordering

T2K and NOvA Combined

1 and 2 σ Contours for Starred Point for NOvA + T2K

1 and 2 σ Contours for Starred Point for NOvA + T2K

Conclusions I

- Due to its long baseline and ease of running antineutrinos, NO ν A will produce important results unavailable from any other experiment in its time frame.
- It is complementary to both T2K and Daya Bay.
- What was to become NO ν A had its first workshop in May 2002. It has now passed all of its reviews and is ready to start construction in the spring of 2009, assuming funding will be available. All of the other major US neutrino accelerator initiatives being discussed today are in the workshop phase.

Conclusions II

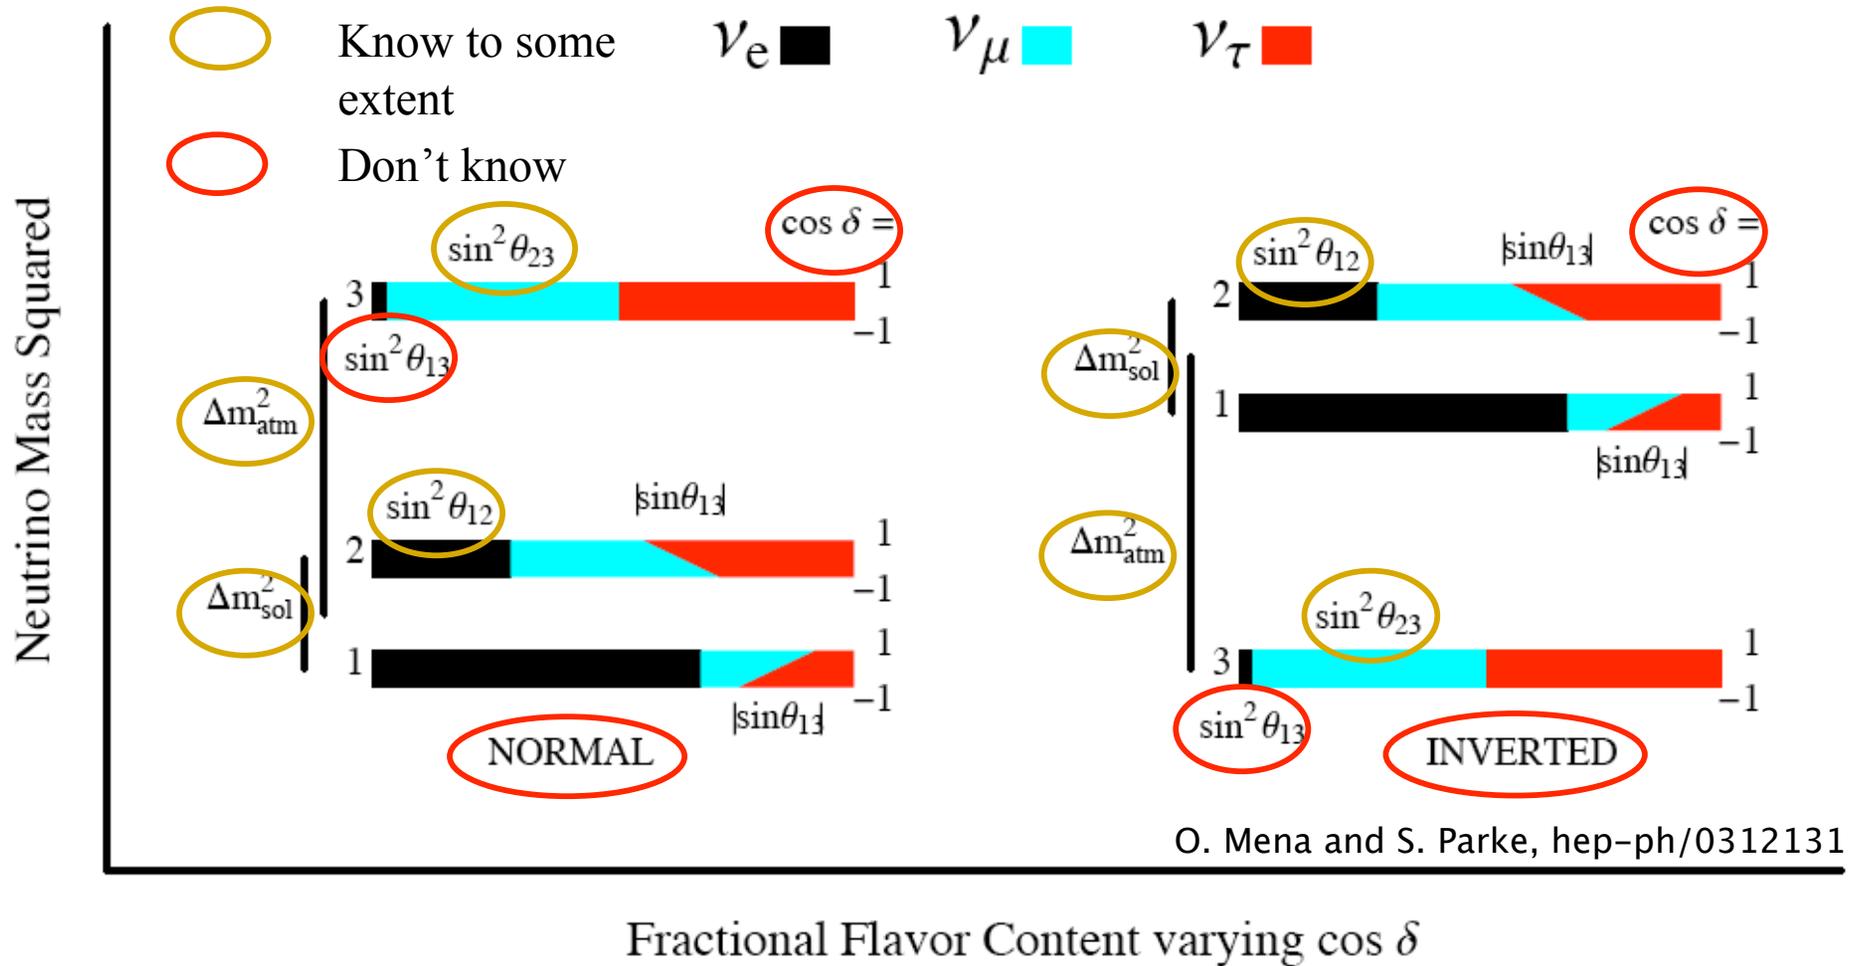

- NOvA will be the anchor of the US accelerator neutrino program. In addition to its unique physics contributions,
 - It will provide the incentive to increase the NuMI beam power from 400 to 700 kW, and then to either 1.2 MW (SNUMI) or 2.3 MW (Project X), depending on available funding.
 - It will provide the physics rationale for building LAr5, i.e., doubling the capacity of NOvA.
 - It will provide the continuity necessary to keep the program running smoothly, e.g. training experimental and accelerator physicists.

What We Know and What We Don't Know

NOvA Near Detector

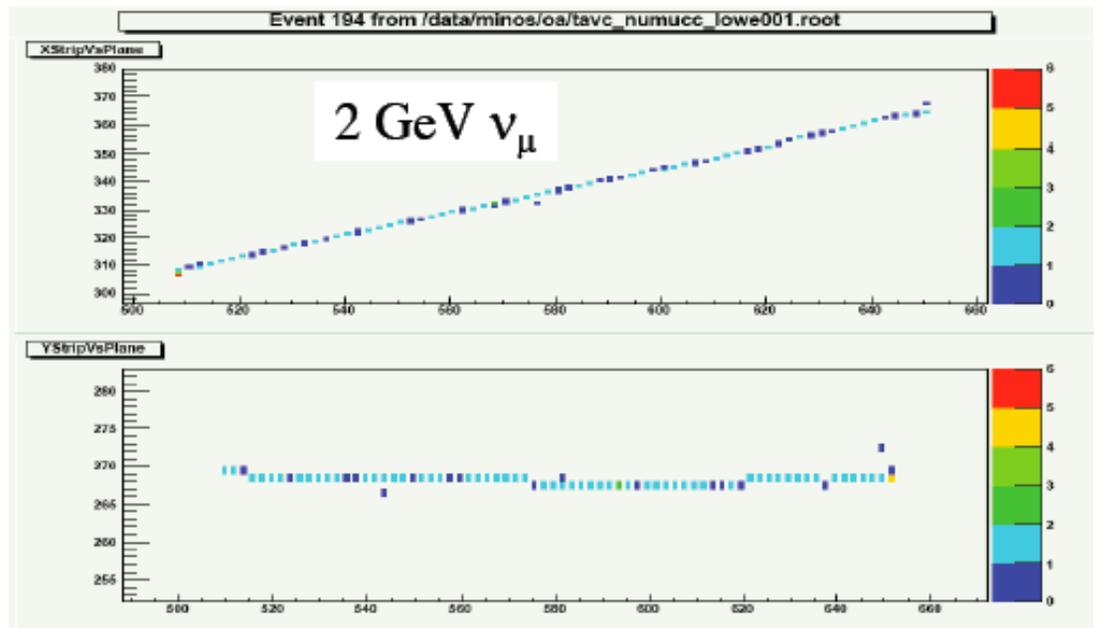

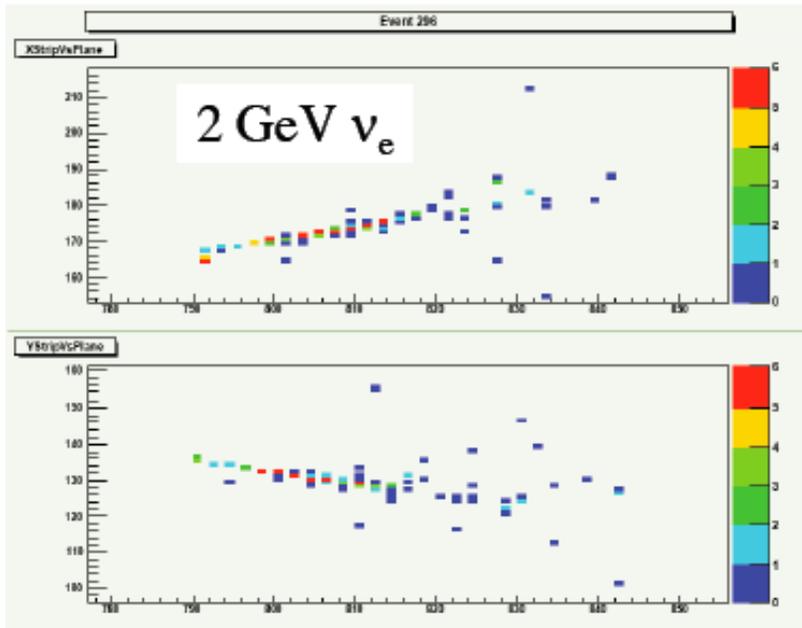

Event Quality

Longitudinal sampling is 0.15 X0, which gives excellent μ -e separation.

A 2-GeV muon is 60 planes long.

ν_e CC event

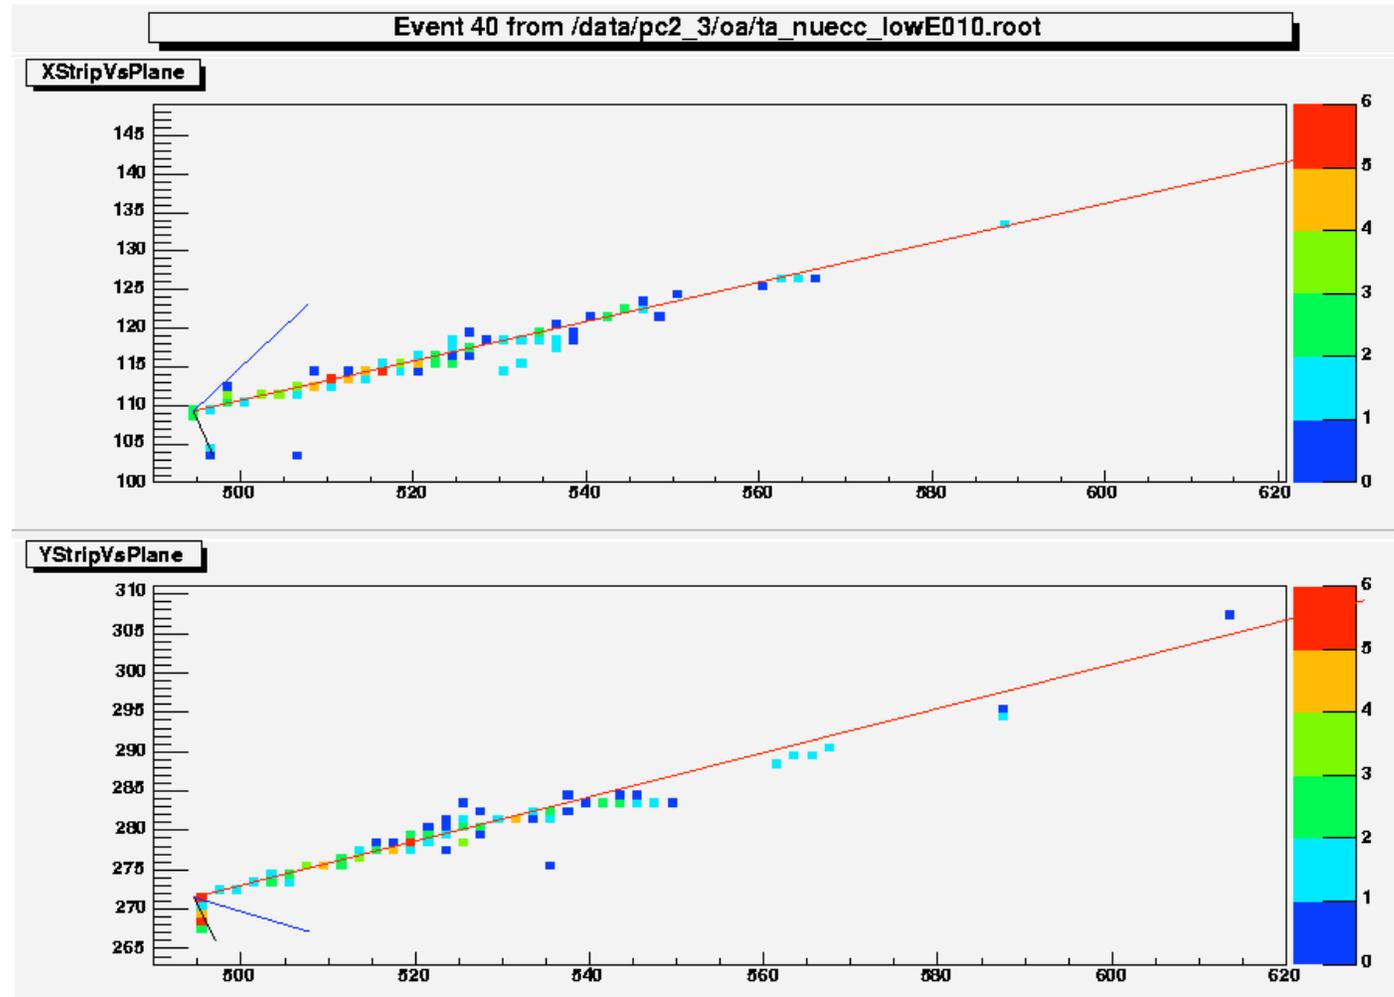

$$\nu_e p \rightarrow e^- p \pi^+$$

$$E_\nu = 2.5 \text{ GeV}$$

$$E_e = 1.9 \text{ GeV}$$

$$E_p = 1.1 \text{ GeV}$$

$$E_\pi = 0.2 \text{ GeV}$$

Background NC event

$$\nu_{\mu} N \rightarrow \nu_{\mu} \rho \pi^0$$

$$E_{\nu} = 10.6 \text{ GeV}$$

$$E_{\rho} = 1.04 \text{ GeV}$$

$$E_{\pi^0} = 1.97 \text{ GeV}$$
